

Did the July Redesigns Move Conversion?

Statistical read of the checkout funnel · prepared 2026-07-09 · source: canonical §M17 (verified) + 7/08 daily KPI

Two release rounds sit inside these windows — this matters for attribution:

ROUND 1 · SHIPPED JUL 3

Landing page + SUP

+ minor changes, incl. **minor payment tweaks**.
Isolated by the **After window (7/03–7/07)**.

ROUND 2 · SHIPPED JUL 8

Landing v2 + SERP + SUP + PAYMENT

First live day = **Yesterday (7/08)**. The **payment page changed here, not in Round 1**.

Consequence: the **major payment redesign is Round 2** — only minor payment tweaks were live in the After window — so a large payment-driven Attempt move in 7/03–7/07 is **unlikely, though not impossible**. Round 2's full payment impact only begins to show yesterday.

Bottom line up front

- **One change is statistically significant — and it's a win:** Round 1 lifted landing engagement (LP Step 2) 39.5% → 49.4% ($p = 0.001$).
- **The scary bottom-of-funnel drops are NOT significant.** Round 1's Attempt move (23.3% → 11.5%) is $p = 0.076$; total CVR (2.04% → 0.88%) is $p = 0.107$ — on 11 vs 5 paid trials. Directional, not conclusive.
- **The payment page is largely cleared by timing.** Its *major* redesign is Round 2 (7/8) — only minor payment tweaks were live in the After window — so a large payment cause for the Round-1 Attempt dip is unlikely. And on Round 2's first day, paid **Attempt ran 33%** — the highest of all three periods.
- **The one large, consistent, actionable signal is thin-match on paid traffic:** yesterday 62% of paid searches hit a no-records page that converted at ~0%. That's the real ad-CVR lever — and it's already in flight.

1 · The funnel across the two rounds

Significance = two-proportion z-test, **Before vs After (Round 1 effect)**. Yesterday is Round 2's first day (paid Search cohort; small n — see §4).

Terminology: **SUP (Signup)** = email/PII capture (optionally password & phone). **Pay** = billing capture — **Pay Billing View** (reached the billing page) → **Pay Attempt** (card submitted) → **Pay CVR** = paid trials ÷ Pay Attempts (payment success rate). **Total CVR** = paid trials ÷ visitors (end-to-end).

FUNNEL STEP	BEFORE 6/28–7/02	AFTER · R1 7/03–7/07	Δ PT	SIG. (B→R1)	YESTERDAY 7/08 · P
Visitors	539	567	—	—	
LP Step 2% (of visitors)	39.5% 213/539	49.4% 280/567	+9.9	SIG · p .001	6 4
Search% (of visitors)	49.7% 268/539	52.0% 295/567	+2.3	NS · p .44	5 3
SRP View% (of search)	87.7% 235/268	85.8% 253/295	−1.9	NS · p .50	3 1
Report Select% (of SRP)	60.9% 143/235	66.0% 167/253	+5.2	NS · p .24	8 1
Thin-Match View% (of search)	12.3% 33/268	14.2% 42/295	+1.9	NS · p .50	6 2
SUP PII% (signup ÷ search)	27.6% 74/268	20.7% 61/295	−6.9	MARGINAL · p .054	2
Pay Billing View% (of visitors)	13.5% 73/539	10.8% 61/567	−2.8	NS · p .16	1
Pay Attempt% (card ÷ billing)	23.3% 17/73	11.5% 7/61	−11.8	MARGINAL · p .076	3
Pay CVR% (paid ÷ attempt)	64.7% 11/17	71.4% 5/7	+6.7	NS · n<18	6
Total CVR% (paid trials ÷ visitors)	2.04% 11/539	0.88% 5/567	−1.16	NS · p .107	3. 2/67

SIG p<0.05 **MARGINAL** 0.05≤p<0.10 **NS** p≥0.10 / n too small

Highlighted rows = the changes under scrutiny

Method: two-proportion z-test (pooled), two-tailed. Attempt, Billing, Total CVR, Visitors are exact from §M17; intermediate step counts are reconstructed from verified percentages (±1). Yesterday is the "By channel (non-internal) — Search" cut = paid only.

2 · Round 1 (7/3) effects — Before → After · hypotheses & evidence

▲ LP Step 2% 39.5% → 49.4% **SIG · p .001**

H1 — The Round-1 landing redesign lifted engagement. **(supported)**

- ▲ Only significant change; timing coincides exactly with Round 1 (cleaner IA, trust-first hero, tightened wizard step 1).
- ▲ Directionally corroborated by Report-Select (+5.2pt, though NS).

H2 — Traffic/keyword mix improved independently of the page.

- ◆ Not ruled out without keyword data; but Search% (of visitors) barely moved (+2.3, NS), which argues the lift is engagement, not a wholesale intent shift.

Take: bank as a real win; attribute cautiously until keyword mix is confirmed stable.

▼ SUP PII% (signup ÷ search) 27.6% → 20.7% MARGINAL · p .054

H1 — Round-1 SUP redesign reduced record→signup. (most likely)

- ▲ The "via records" sub-branch fell 40.6% → 31.1% — exactly the page Round 1 touched (headline/bullets/CTA on the SUP).
- ▼ Marginal (p=0.054); yesterday's blended PII% (23%) sits back between the two windows.

H2 — Denominator shift: more traffic to the lower-converting thin-match branch.

- ▲ Thin-match share rose; that branch signs up far less, so blended PII% falls even if each page is unchanged.

Take: real candidate, second priority to thin-match. Re-test the SUP records path directly.

▼ Pay Attempt% 23.3% → 11.5% MARGINAL · p .076 — "payment problems"

H1 — Unlikely to be the payment page. (timing makes a large effect improbable)

- ▲ The *major* payment redesign shipped in Round 2 (7/8). In this window (7/03–7/07) only **minor payment tweaks** were live — so a large payment-driven Attempt drop here is improbable.
- ◆ But minor changes can't be fully excluded as a small contributor — this isn't chronologically airtight.

H2 — Composition: Round-1 changes altered *who* reaches billing.

- ◆ More top-of-funnel volume (LP Step 2 ↑) can pull in lower-intent visitors who reach billing but abandon the card step — lowering Attempt% without any billing-page change.

H3 — Statistical noise. (cannot be excluded)

- ▲ 17/73 vs 7/61 → z=1.78, p=0.076 — below the bar; one extra conversion after closes most of the gap.

Take: not a payment bug. Confirm composition vs noise with the `payment_submit` vs Attempt + `validation_error` pull. No revert warranted.

▼ Total CVR 2.04% → 0.88% NS · p .107 — the headline number

H1 — Net funnel got worse.

- ▼ Not significant (p=0.107); driven by 11 vs 5 paid trials — far too few to call.

- ▼ Reverses on Round 2's first day (yesterday paid CVR 3.0%).

H2 — Thin-match diverted convertible traffic.

- ▲ More searches ending on a ~0%-converting page mechanically lowers total CVR regardless of page quality.

Take: do not present "CVR halved" as established — it is a non-significant, low-n directional dip.

3 · Round 2 (7/8) effects — After → Yesterday · how the new changes shifted Round 1

Round 2 added **Landing v2, SERP, SUP tweaks, and the Payment redesign**. One day of paid data — small n, so read as direction, with Wilson 95% CIs.

▲ Pay Attempt% 11.5% (R1) → 33% (R2) — payment redesign's first read

Round 1 dipped it → Round 2 recovered it above baseline.

H1 — The Round-2 payment redesign did not hurt (may have helped).

- ▲ Payment changed 7/8; the first day shows Attempt at 33% (3/9) — the highest of all three periods, above even the healthy Before (23.3%).
- ▼ 3/9 is tiny (95% CI 12–65%) — spans both prior windows, so "helped" is not yet demonstrable.

H2 — Regression to the mean from a noisy R1 low.

- ▲ If R1's 11.5% was a low-sample fluke ($p=0.076$), a bounce back toward the low-20s% is expected with or without a redesign.

Take: the payment redesign is not a conversion problem on first evidence. Keep watching as volume builds.

◆ SUP PII% 20.7% (R1) → 23% (R2)

Slight recovery toward baseline.

H1 — Round-2 SUP tweaks partially restored signup.

- ◆ Direction is right, but 9/39 (95% CI 13–38%) overlaps both windows — not distinguishable yet.

◆ Thin-Match View% 14.2% (R1) → 62% (R2 · paid) — the real lever

Large jump — but paid-specific and partly a one-day spike.

H1 — Paid keywords skew to common names → provider returns no records.

- ▲ Yesterday all 24 thin-match views were in the paid channel; non-paid search went almost entirely to records. Paid clicks disproportionately hit the no-records page.
- ▲ Mechanism understood: common names → IDI teaser `TooManyMatches` ; adding city/age doesn't currently narrow the provider search.
- ▲ Thin-match converted to **0 paid trials** yesterday; every conversion came from the records branch.
- ▼ 62% is inflated — thin-match spiked +169% vs day-of-week; steady-state is ~12–14% blended. The direction (paid > non-paid) is the durable part.

Take: this is where ad CVR is actually lost. Two levers already in flight — reduce the *rate* (provider-side narrowing) and improve the *experience* (redesigned preview cards + signup A/B shipped 7/8, part of Round 2).

▲ Total CVR `0.88% (R1) → 3.0% paid / 1.2% global (R2)`

Up on Round 2's first day.

H1 — Round-2 changes (or normal variance) lifted conversion.

- ◆ Paid 2/67 (95% CI 0.8–10.2%) and global 2/168 (95% CI 0.3–4.2%) are both too wide to confirm a real lift — but neither is consistent with a worsening funnel.

4 · Caveats to disclose (before anyone over-reads this)

- **Sample size / power.** Deep-funnel steps carry <20 events per window (paid trials 11 → 5 → 2). At these counts only a very large effect clears $p < 0.05$ — so "not significant" means "under-powered," not "no effect." We should not conclude a break or a fix.
- **Single-day noise.** Yesterday's thin-match spike (+169% DoW) shows how volatile daily reads are; Round 2 has one live day. Do not steer roadmap on it yet.
- **Overlapping rounds.** Round 2 bundles four changes (landing v2, SERP, SUP, payment) shipped together — their individual effects are not separable from one day of data.
- **Reconstructed intermediate counts.** Step-level n's are derived from verified percentages (± 1); Attempt / Billing / CVR / Visitors are exact.

5 · What the data supports doing

- **Keep the Round-1 landing redesign.** LP Step 2 is the one significant, real gain.
- **Do not revert the payment page.** Its *major* redesign is Round 2 (7/8), not the After window; only minor payment tweaks were live during the Round-1 Attempt dip, so a large payment cause is unlikely — and Round 2's first day showed Attempt at 33%. Confirm with the `payment_submit` vs Attempt + `validation_error` pull rather than reacting.

- **Prioritize thin-match — it's the real ad-CVR lever.** Most paid searches die there at ~0%. Reduce the rate (provider-side narrowing for common names) and improve the experience (already shipping in Round 2).
- **Let volume accumulate** before drawing significant conclusions — current windows are directional only, and Round 2 has just one day live.

Prepared for internal + investor review, 2026-07-09. Significance via two-proportion z-tests; CIs via Wilson score interval. Figures marked $\pm$ are reconstructed from verified percentages. Not a forecast — a read of what the current (sparse) data does and does not establish.
